

Making Recovery Mode Boot in Linux Mint 20, kernel 5.4.

Shut down the computer and restart

At Grub boot select Advanced options, press enter.

Move down with the arrow to the recovery mode option. Don't press enter.

Press e.

Move down the cursor to the point that says nomodeset , delete it. Not the whole line just nomodeset.

Press ctrl+x or F10 to boot.

The changes you made up to now are not permanent. On next reboot things will be as they were before.

If you want to make it permanent, I discourage that, for 2 reasons.

The file you need to edit is /boot/grub/grub.cfg. At the top of the file is written DO NOT EDIT THIS FILE. What would you do is actually the same thing. Find the sections with nomodeset after recovery and delete and save the changes. These sections are the recovery mode sections not the main and there is one for every kernel you have installed.

Second, you don't enter recovery mode everyday, so whenever needed just repeat the process.
