

## Virtual Box on Mac keyboard.

The host key simply doesn't exist in order to manipulate the screen while you are on a scaled mode. The menu will not be available until you exit.

Process to define a new key or combination.

Enter preferences of Virtual Box.

Enter the Input section.

Select the Virtual Machine tab.

Set host key combination to none by clicking on the predefined host key.

Save the settings.

Repeat the process.

Make the "none" on host key combination "blanc" by pressing the left control key.

In my keyboard the only acceptable hostkey combination was left-ctrl+left-alt.

Save the settings.

The change will apply automatically to all the combinations affected by the host key although they all will still

be associated with the term host. It doesn't matter. You have set the host key.

Scroll down until you see scaled mode. It says Host+c. It's actually Left-

ctrl+left-alt+c

and this combination will exit the scaled mode and the menu will be available.

END
